

Abstract

Introduction

Behcet's disease is a systemic inflammatory condition with various clinical presentations. Our patient presented with acute heart failure. Even though myocarditis is reported in Behcet's disease, initial presentation as acute heart failure is very rare. He made a good recovery following immunosuppressive treatment.

Conclusion

Behcet's disease is rare in Sri Lanka. There should be high degree of clinical suspicion in patients presenting with atypical features and clinicians should be familiar with diagnostic criteria. Early initiation of optimal treatment is important in achieving clinical remission.
