

Abstract

Ischemic stroke is a major disabling disease among elderly population as well as minority of young population. Ischemic stroke can present with motor deficit, sensory deficit, imbalance, higher function abnormalities and altered conscious level. Our case highlights the importance of considering B/L thalamic infarction as one of the causes for altered conscious level. Our patient is a known case with Diabetes, Hypertension and Ischemic Heart disease presented with altered conscious level, imbalance and language difficulty. She was diagnosed to have B/L thalamic infarction by imaging studies. She was treated according to current stroke guideline and transferred to cardiology unit for further management after neurologically stable.
