

Abstract

Vertebral osteomyelitis is a rare entity and primarily found in adult over 50 years with male predominance. In here we report a case of 19-year immunocompetent girl with the history of fever and lower back pain and spinal tenderness found to have vertebral osteomyelitis and started on sensitive antibiotics and rapid improvement was noted. It's essential to suspect the possibility of vertebral osteomyelitis in young age group who are presenting with the pathognomonic signs and symptoms.
