

Abstract

A-67- year old patient presented with severe loss of appetite and loss of weight and fatigue for 2 months duration. There were no evidences to suggest any malignancy, or any chronic disease except chronic obstructive lung disease. He was cachectic & other positive finding was irregularly irregular tachycardia which directed the line of investigation of hyperthyroidism. His thyroid profile revealed, low TSH and high free T4 and T3 and then the diagnosis was made as apathetic thyrotoxicosis which is an atypical presentation of hyperthyroidism in elderly.
