MD (OTORHINOLARYNGOLOGY) EXAMINATION - NOVEMBER 2019

Date:- 5th November 2019

Time :- 1.00 p.m. – 4.00 p.m.

PAPER III (General Surgery)

All six (06) questions to be answered.

1. A 68-year-old smoker was diagnosed with a resectable 1 cm diameter well differentiated squamous carcinoma of the right lateral tongue edge. Clinical examination and imaging confirms it to be localized disease which no cervical nodes. He has a past history of ischaemic heart disease and has been stented six months ago.

Discuss and prioritise the factors that need to be taken into consideration in managing this patient.

2. Discuss obtaining skin and tissue cover in head and neck surgery.
3. Discuss the role of imaging in diseases of the head and neck region.
4. Outline the initial assessment and principles of management in a patient presenting with severe sepsis.
5. You are called to see a 67-year-old man three days after major surgery. He is agitated, abusive and has to be restrained from pulling out his IV lines and getting out of bed. The medical officer informs you that he appeared well the previous evening. The patient's notes indicate that he has diabetes and a history of excessive alcohol use.

Outline the management of this patient with an emphasis on prioritizing the causes for his presentation.

6. Write notes on –
 - 6.1. The use of local anaesthetics in surgical practice.
 - 6.2. Sequelae of prolonged immobilization in surgical patients.
